You have reached your collections limit. Upgrade to get unlimited collections Register and create new collections Register for free Get browser-proof, accessibility-friendly, and fast-loading icons in just 3 steps! The official way to use Font Awesome Free or Pro icons on your site, brought to you by the Font Awesome team. Features Our official plugin lets you use Font Awesome the way you want: Use Pro or Free icons. Leverage the latest release or a specific version of our icons. Choose the tech, either SVG or Web Font. Take your pick of loading your icons from our classic Font Awesome CDN, or use Font Awesome Kits - the easiest and most efficient way to use Font Awesome icons on the web. Turn on automatic compatibility for Font Awesome Version 4 if you - or your plugins - are still using Version 4 syntax. Troubleshoot and resolve issues when multiple versions of Font Awesome are loading on your site from other plugins/themes, which can cause unexpected icon display or technical issues. Make things even awesomer using icons from Font Awesome Version 6. Use your uploaded icons from your Pro Kits. Note: The plugin is not compatible on WordPress multisite at this time. How to Use Install and enable the plugin (See the Installation tab for details) Add icons to your pages and posts Adding icons works in both the block editor and the classic editor. Once you've set up your plugin, you can search and add icons to your pages and posts by choosing the Font Awesome option in the format bar from any text block to open the Icon Chooser. (If you want to search and add Pro icons in the Icon Chooser, you'll need to use a Pro Kit.) Or you can use the icon names in shortcodes or HTML. When you use shortcodes, you add the name of the icon and a prefix, where the prefix is the style of icon you want to use. Note that you don't need to include the fa- part of the name. And if you don't include any prefix, the icon will default to the Solid style. The shortcode for an icon looks like this: [icon name="stroopwafel" prefix="fa"] Get the details on all the shortcode options in the Font Awesome WordPress docs. You can also use basic HTML with standard Font Awesome syntax, like this: Using Pro Icons and Features To use a Kit, create a Kit on FontAwesome.com and select "Pro icons" in the settings. Then grab your API Token from your Font Awesome account page to add into the WordPress Kit settings. To add Pro icons with the CDN, you'll need to add your domain to the list allowed domains on your Font Awesome account CDN Settings page and use shortcodes or HTML to add the icons into your content. If you're using the Icon Chooser, you'll need to use a Pro Kit. (The CDN can only search and add Free icons - use shortcodes or HTML to add Pro icons when using the CDN). Troubleshooting with the Plugin Font Awesome icons are popular, so lots of themes and plugins also load Font Awesome, and sometimes their version can conflict with yours. So we created a way to help you find and prevent those conflicting versions from affecting your icons: The Conflict Detection Scanner. If the plugin seems to be set up correctly and your icons still aren't loading and you're not sure why, head over to the Troubleshoot tab, which has two parts: Detect Conflicts with Other Versions of Font Awesome - which lets you start the conflict detection scanner to find versions of Font Awesome loading on your site. Versions of Font Awesome Active on Your Site - which shows the results of the scanner and lets you prevent any conflicting versions from loading other versions of Font Awesome on your site. Get more information about using the scanner for troubleshooting on the Font Awesome WordPress docs. Configuring The plugin is set to serve Font Awesome Free icons as a Web Font via the Font Awesome CDN by default. You can change the CDN settings right in the plugin. If you want just the basic Free icons, you probably don't need to make any changes to the default configuration. You can get more information about all the available settings and troubleshooting on the Font Awesome WordPress docs. Upgrading from the Old Versions If you used the old plugin or are still using Version 3 of Font Awesome, we've tried to smooth the upgrade path for you by keeping [icon] shortcode compatibility for Font Awesome 3 names used with the old plugin. But we plan to remove version 3 naming support from this plugin soon so don't wait too long to update your code! See Also the README on GitHub has details for WordPress site owners and developers. And there are API docs for developers. Add icons in any text block from the editing bar Search and add icons from Font Awesome Free or Pro (with subscription) View the icons in Preview mode or in published pages and posts Use a Font Awesome Kit to power your site's icons Or use the Font Awesome CDN Detect and fix issues with conflicting versions of Font Awesome running on your site Add icons in Classic Editor as well From the "Add Plugins" page in WordPress admin: Search the plugins directory by author: fontawesome Click "Install" on the Font Awesome plugin in the search results Click "Activate" Installing a Zip Archive Click Download on this plugin's directory entry to get the .zip file On the "Add Plugins" page in WordPress admin, click "Upload Plugin" and choose that .zip file Access Font Awesome Plugin Settings Once you activate the Font Awesome plugin, you will see Font Awesome in the Settings menu in your WordPress admin area, or you can click "Settings" on the plugin listing on the Plugins page. The plugin is set to serve Font Awesome Free icons as a Web Font via the Font Awesome CDN by default. You can change the CDN settings right in the plugin. If you want just the basic Free icons, you probably don't need to make any changes to the default configuration. Using Pro Icons and Features To enable Pro icons with the CDN, you will need to add your domain to the list allowed domains on your Font Awesome account page. To configure a Kit, get your API Token from your Font Awesome account page. You can get more information about all the available settings and troubleshooting on the Font Awesome WordPress docs. You can get more information about using the plugin, details for available settings, and answers to frequently asked questions on the WordPress docs on Font Awesome. It breaks everything on my website. Icons don't work properly. Never set up it. As soon as I enabled it the entire site was down - stuck with the browser trying to connect to fontawesome. not very awesome... The Font Awesome plugin makes it easy to stay on top of the latest version that is otherwise hidden away in some assets folder. Block editor support makes it easy to insert icons without having to remember their names. Can't wait for version 6. This works perfectly for me where others didn't. This plugin work great as they did not left the junk behind in the DB on uninstall. But I found no option to use the Font Awesome assets (such as CSS+fonts) on my local site without CDN access. For example that I may have to install the website and then use in the intranet where no external access. However, there is some errors with WordPress 5.9-RC2-52567. PHP 7.1. It said: Undefined variable: should_enable_icon_chooser in font-awesome/includes/class-fontawesome.php on line 1623 Just as the name implies - awesome plugin! I use it for all of the pages & posts on my site & the icons are super easy to add with the Visual Composer website builder frontend editor. Would recommend checking it out! Read all 48 reviews Make Font Awesome 6 the default version on new activations. On the version selection dropdown, distinguish between the latest 5.x and the latest 6.x. Maintenance updates to JavaScript dependencies. Developers: the latest_version() method has been deprecated and replaced by two alternatives: latest_version_5() and latest_version_6(). Simplified upgrade logic: makes the upgrade process on the first page load after upgrade quicker and smoother. Added support for using Font Awesome Version 6 Free with CDN. In order to use Version 6 Pro with this plugin, it's still necessary to use a Kit, since Version 6 Pro is not available on the classic CDN. Renamed the "Version 4 Compatibility" option as "Older Version Compatibility", since compatibility features may now involve both Version 4 and Version 5. Updated version of the conflict detection script used when configured for CDN. FIX: in some cases, when running the conflict detector on the back end, there was an error about an undefined variable called \$should_enable_icon_chooser. Fixed. FIX: in some cases, when running php 8.0 or higher, there was an error related to calling method_exists(). Fixed. Developers: The v4_compatibility() method has been deprecated and will be removed in a future release. It's now just compatibility(). Developers: The preference named

"v4Compat" in the array argument to the register() method has been deprecated and renamed "compat". Any uses of "v4Compat" are automatically translated to "compat". Developers: There are no breaking changes. Any code that uses the above deprecated features will continue to work the same without modification in this release. FIX: add hash values to JavaScript chunk file names to resolve the problem where sometimes an old cached version of a JavaScript file would load in the browser instead of the intended updated one. This caused some users to see a blank settings page after upgrading from a previous version of the plugin. FIX: When in the Classic Editor in WordPress 5, do not load block editor script dependencies that assign to the global wp.editor object. This prevents problems with other plugins on the page that may depend on that global. FIX: When in the Classic Editor where multiple editor instances are present, ensure that the Add Font Awesome media button on each is wired up to load the Icon Chooser on click, not just those buttons that were on the page at the time this plugin's initialization code is run. FIX: re-enable the Icon Chooser in the Classic Editor on WordPress 4. FIX: in some cases where the path to the plugin was a non-standard location-such as when installed via composer-the admin settings page and Icon Chooser would not load correctly. Fixed. FIX: the global version of the lodash JavaScript library was again being overwritten by the version used by this plugin. Fixed. The Icon Chooser's integration with the Block Editor (Gutenberg) has been disabled for WordPress 5.0, 5.1, 5.2, and 5.3, due to incompatible JavaScript libraries. All other features of the plugin work normally on those versions, including Icon Chooser integration with the Classic Editor. FIX: In scenarios where both Gutenberg (Block) and TinyMCE (Classic) editors were being loaded onto the same page, the Gutenberg editor was not displaying properly. Now, in that multi-editor situation, the Icon Chooser integration is only enabled for the block editor. In those cases, you can still use icon shortcodes or HTML in the TinyMCE editor boxes; those editors just won't have the "Add Font Awesome" media button for opening the Icon Chooser. The Icon Chooser is still available from the Classic Editor when the block editor is not present on the page. FIX: In scenarios where there are multiple TinyMCE editor instances on the same page, such as WooCommerce product editing pages, only the "Add Font Awesome" media button on the first of those editors was working correctly. Now all of them work correctly. FIX: In the Classic Editor, when other themes or plugins added media buttons after the "Add Font Awesome" button, those buttons were showing up as combined together and not working properly. Now they're separated and working great. The Icon Chooser integration for the Classic Editor in WordPress 4 has been temporarily disabled. Everything else works as before in WP4, just not the new Icon Chooser. OFFICIAL 4.0.0 STABLE RELEASE FEATURES: Includes all the features from the early 4.0.0 release candidates (details below) FEATURE: Visual icon chooser lets you search and easily insert the correct shortcode. Fixed regression on overriding global lodash version. Added PHP API method to get current Kit token. Removed the filter to process all shortcodes in widget text. This seems to have been an overly eager approach on our part. If you want shortcodes to be processed in widget text - all shortcodes, not just this plugin's icon shortcode - you can add a line like this to your theme's functions.php file: add_filter('widget_text', 'do_shortcode'); FIX: plugin now handles Kits with version "5.x" or "6.x" FEATURE: shortcode supports attributes: style, role, title, aria-hidden, aria-label, aria-labelledby Metadata about available Font Awesome releases is now stored as a normal option in the WordPress database, instead of as a transient. Thus, it does not expire and does not disappear if the transient cache is purged.

13/11/2012 · I am wondering if it's possible to utilize font-awesome (or any other iconic font) classes to create a custom list-style-type? I am ...
