U.K. researchers studied five university soccer players as they prepped for matches. The players picked their favorite pump-up jam and listened to a recorded verbal script of their best plays. While some of the players responded well to the just music or the script, when the two were combined, the players reported that their sense of flow increased by an average of 40 percent. More from MensHealth.com: Build Muscle with Your Mind "You hit all bases if you use both combined. Some players struggle with imagery, some with music. Both together provide a bigger hit," says lead study author Matthew Pain. The music relaxes you, while imagery improves confidence—meaning you interpret stress in a way that improves performance instead of detracting from it. "We think there may be a hypnotic effect going on with some players," says Pain. Here's how to do it on your own, Pain says: Pick a song It should be something that puts you in a "powerfully positive state," says Pain. Other than that it doesn't really matter. One player in the study chose the classic "Eye of the Tiger," by Survivor. Another chose "My Love," by Justin Timberlake. Write your script Next, make a list of the key aspects of your position, or, if it is an individual sport, the key stages of the event. For each aspect or stage, remember what happened the time you did it best and write it down as a first-person script. Make your mix Record the script as an MP3 file and combine it with the song you picked using Garageband, Adobe Audition, or Audacity. (You can skip this step if you don't have these programs.) Prep for competition Finally, listen to the recording in a quiet place as close to the start of the competition as possible. "The closer the better usually," says Pain, "but I encourage athletes to experiment and see what works for them." This content is created and maintained by a third party, and imported onto this page to help users provide their email addresses. You may be able to find more information about this and similar content at piano.io Bustabit is a betting game where you try to guess the largest possible magic number in each contest. Sounds kinda dull, but there's a catch: this number is a Bitcoin multiplier! So, there's actual money involved in bustabit.Lots of it. How does Bustabit work? If you guess a multiplier before the game crashes, you earn that much more Bitcoin than you bet. Which means that, if you play Bustabit right, in theory it's possible to multiply your Bitcoin stash several times over in very little time. If the game crashes before you guessed number is reached, you lose your entire bet. As you can imagine, you can also lose all your Bitcoin rather quickly, especially if you enter a losing streak and let emotions get the best of you. Disclaimer Before we proceed, please read this important notice: Bustabit is gambling. Only gamble what you can afford to lose. Nothing in this article constitutes investment or gambling advice of any kind. This article offered for informational purposes only. Bustabit Rules Bustabit is a very simple game, with very few rules. In every contest, you first allocate a certain amount that you wish to bet. You can see every other player's bet amount on a screen to the right of the main game area and then decide if you'll play or not based on that. The system then begins counting up a fractional amount, starting from 1. You must hit a stop button before the counter collapses to zero (Bust!). Contests are very quick, often lasting just a few seconds, sometimes even under a second. The fractional amount that gets frozen when you hit the stop button is your multiplier. Just as I edited this post, a 7.3x multiplier was drawn. According to the Bustabit system, someone made 68.53 BTC profit in this session. If you let the counter collapse to zero before you hit stop, your stake is lost (because it's multiplied by zero). Otherwise any multiplier above 1 will be profitable and you'll end up with more than you staked. You don't have to stake your bankroll (entire account balance) in each contest. In fact, it's recommended you balance risk x reward by betting smaller amounts and by not getting greedy on the stop button. We'll talk about risk management in a while, for now let's take a look at how bustabit is played. Bustabit Gameplay First, create your free account if you haven't. All players must have a username/password. Bustabit Registration Screen - Create Your Account Fund Your Bustabit Account Now it's time to fund your account. Make sure to never sends funds from an exchange account. This is good advice regardless if you're joining an ICO or playing bustabit - because the exchange return address is invalid. Should anything happen and your deposit be bounced, the exchange exit address does not credit your account. In these cases, the coins are usually lost, unless you're lucky enough to get a hold of someone from a crypto exchange tech support. (The odds of winning 1 million multiplier on bustabit is actually higher than reaching a crypto exchange tech support person.) Enter Play Window Then you'll want to enter the play window. In this window you'll find a chat room where you can interact with other players as well as the betting commands and the list of players who joined in the current bet. The players in red failed to cash out before Bustabit crashed. They lost their entire bet in this contest. Those in green got out and profited the amount on the right column. Take, for instance, green user number 6. He/she bet 11,100 bits and got out at 2x. That is, they got out when the game was 22,200 so they earned 100% (11,100 x 2). You should probably focus on gameplay rather than hang out at the chat room. When you're done and want to chat, then go for it. The chat will usually distract you, so don't pay attention to all the noise while you're betting. Now, let's take a look at some sound ideas for Bustabit risk management. Bustabit Risk Management Bustabit is an all or nothing betting game. You either win or lose your entire stake in each contest. Very quick contests often lead players to take poor risk management decisions. Especially after a winning streak when overconfidence takes over. If you get greedy you will eventually be zeroed out and lose your entire stake. There are two variables you can adjust to manage your risk: the amount of time you wait before hitting stop and how much you bet in each contest. If you get greedy and begin waiting too long to hit stop, chances are you'll get zeroed out. Also if you get greedy and bet your entire stash at once, you might lose everything in one mistake. By choosing appropriate fractions of your stash and how long you wait before hitting stop you might be able to stay in the game a long time without getting busted. The Best Bustabit Strategy First of all, keep in mind that any multiplier above 1x means you earn more than you bet. The central idea behind a successful Bustabit strategy is to play a high number of contests betting very little, often stopping right when the counter begins to grow. (At the end of this section we'll reverse engineer the game to avoid getting Bustad! There you have it. By looking into some publicly available numbers, we've been able to reverse engineer the #1 winning player's strategy: Play lots of games. Tens of thousands, in fact. Make very little profit in each game. (e.g. Stay under 1.09x multiplier.) One more important fact: notice how even the #1 winner has made some heavy losses in the process. In order to make take 469 BTC, this player lost 21.55 BTC in the process. That's a 4.59% loss compared to profits. Take this into consideration when you enter Bustabit. The average winning multiplier is just under 9% and the losses are 4.5% of the 9% (the fact that 4.5 is half of 9 is just a coincidence here, or is it?). (One more disclaimer, just in case: Please do your own research and keep in mind that Bustabit is a high risk gambling activity. Remember, you can lose 100% of your Bitcoin very quickly. Nothing in this article configures investment or gambling advice.) Various Bustabit Strategies There are several different strategies used in Bustabit going around by several names. As we've mentioned earlier, Bustabit is a random game where each draw is an independent event. Thus, any strategy which is based on historic odds influencing future odds in Bustabit is inherently broken. So, let's take a look at these additional Bustabit strategies for the sake of completeness. Crazy Multiplier Strategy In this strategy, the player writes a bet to wait for a crazy high multiplier. They play low risk, low reward games until it senses a high multiplier, then goes high risk on that bet. The key here is for the script to be able to sense when a high multiplier round is running - in real time. As you can imagine, this is no easy task and assumes there's some bias the script can detect.Legend has it that some have found a way to do it but, honestly, we don't believe it. In fact, as we've seen, the biggest bustabit winners don't win big on one round and then leave, but keep winning low for thousands of games. We've seen this strategy called "catch Nyan strategy", since you must catch a flying cat. Bustabit Payout Strategy (AKA Bonus Only Strategy) What some are calling the Bustabit payout strategy is exactly what the #1 winner is doing in our example above. Bet a low percentage multiplier each time, repeatedly, adding up to a decent payout over thousands of tries. Likely requires a robot - as does the #1 strategy we reverse engineered earlier. Some call this the "bonus only strategy", for obvious reasons. "Bonus only" is what everyone wants and it's exactly where the game difficulty lies. Martingale Strategy (AKA Go Broke Fast Strategy) In this "strategy" the player bets the amount they just lost plus a wager on the next round. Say they lose 20 on this round. In the next round they'd bet 20 + 20 hoping to win back the lost coins. But there's a problem - they'll need to make a 2x multiplier next round. And so on, the multiplier requirement goes up and so do the risk and the wager. As a result, the player goes bust exponentially as fast as well. Some gamblers have published extensive literature on the Martingale strategy - all of which is completely bogus. One gambler claims to have hit 2x for 32 rounds in a row. Anyone familiar with computers knows 32 bit memory limit, because it's 2 possible bits 32 times over, which is 2^32. So, if you'd win 2x for 32 games you'd make 4 a billion gain.Do the math and see why this is obviously bogus (the bustabit leaderboard shows no one with anything close to a x4 billion gain, for starters). Sniper Strategy (AKA Bustabit Sniping) What some may call a sniper strategy isn't really a strategy at all. In this tactic, the player simply cashes out after a big multiplier is hit, parting on the principle that smaller bonuses will come after a large one. Some Bustabit sniper scripts available on the WWW do nothing except cash out after a large multiple is hit. Fixed Wager / Flat Bet Strategy To maintain a fixed wager for a large amount of rounds. Same strategy used by the #1 winner whose tactics we reverse engineered above, except in our case we did a smart calculation for the wager amount. Don't Play If you research bustabit strategies you may come across a strategy called "don't bet". It's sound advice, TBH. Simply not betting on bustabit raises your odds of not losing money quite a bit. Bustabit Hacks Don't send large amounts of BTC to Bustabit at once. This same advice applies to any new Bitcoin address, not just Bustabit. For example, when you make your first deposit at an exchange you're not familiar with, always send a small amount first. Since Bustabit has been hacked in the past, you should take the same precautions you would anywhere else. Remember the first law of cryptocurrency: If you don't own the keys, then you don't own the coins. To be safe, you should periodically withdraw your Bustabit profits and keep the BTC in your own local wallet, especially if you don't plan on betting for a while. Bustabit Script Bustabit scripts are based on basic gambling theory such as finding and exploiting some bias in the game. There are plenty of reasons to be skeptical about Bustabit scripts.Here we take a look at a few of those. Most gambling involves more psychology than solid mathematical theory. If the house doesn't make a consistent profit, then gambling wouldn't be a business. Keep in mind, then, that the odds of successful gambling are always against you. Script or no script. Here's one example. A Bustabit script was advertised at Bitcointalk. It sells for 0.005 BTC per license and claims to make 0.05 BTC every 24 hours. Let that sink in for a moment. If the script made you 10x return every 24 hours, wouldn't the script owner run it for their own benefit? Why are they selling the script for 0.05 if it'd make them 10x as much in just 24 hours? The time it takes them to sell one copy of the script would be enough to cover its cost. Fortunately, Bitcointalk users were quick to respond. As previously stated, most gambling "theory" revolves around psychological bias rather than math. Check out this particular Bustabit script, for example. It's based on a psychological gambling fallacy called Oscar's Grind. This fallacy states that you're more likely to win after a long losing streak. That's obviously wrong. Most gamblers leave casinos completely broke. There is no consolation winning streak after heavy losses. What this Bustabit script does is keep track of your previous attempts to try and predict future outcomes. Needless to say this doesn't work against a truly random process. If you're not convinced yet, here's one last point about why there isn't such a thing as a winning Bustabit script. Bustabit contests are independent from each other. Most algorithms for Bustabit are based on the false assumption that there's some causation effect between sequences of draws. Something like: if the first 7 contests collapsed at a high multiplier, then the 8th is likely to be a low multiplier. This is absolutely false! The odds of it being a high multiplier on the 9th, 9th and 10th draw are exactly the same as in the first draw. If you actually read the more admod Bustabit scripts that are being sold out there, most of them use stock market indicators. For example, if a large volume of Bitcoin was made in the low multiplier range, then odds are these gamblers will bet at higher multipliers next. This is a natural psychological effect after winning streaks, gamblers have more chips and grow more confident. But stocks aren't completely random, there are company fundamentals and other predictable factors involved (supply chain, observations of their business operations and so on). Bustabit, on the other hand, is completely random. Each draw does not carry anything into the next nor does it borrow anything from the previous draws. Malicious Bustabit Scripts Be careful about malicious bustabit scripts available for download on the WWW. One particular type of malware targets the player's entire bankroll. It is a long script which purportedly applies some strategies and may even win a few rounds, but when it's triggered somehow, it transfers out the player's entire balance. Many cases of stolen bits reported on the WWW may have been due to such scripts. Bustabit Simulator Since Bustabit is a browser-based game, there are several software projects out there who've borrowed and adapted some of its Javascript code in order to make some similar looking interfaces. Here are a few Bustabit simulator scripts : Mtlhc Bustabit Simulator Mtlhc Source Code BaBSS Bustabit Simulator Jsfiddle playground by Aquifer These can be fun to mess with and you could even create your own version of Bustabit. But you're probably here to learn how to win actual Bitcoin on real Bustabit, so I'm sorry to let you down once more. Here's why these simulators don't work for training your scripts to win at the real game. The main reason why a Bustabit simulator can't simulate the actual game is due to randomness. You may have noticed we mention randomness a lot, well it's because the entire Bustabit system depends on true randomness. Just like Bitcoin Block hashes are completely random, Bustabit multipliers are absolutely unpredictable (see next section) as well. There are some very bright mathematicians out there. If Bustabit games could be predicted, some very smart person would write a script to predict game outcomes with high degree of confidence, defeating the house and making a large Bitcoin stash. Bustabit Predictor As we mentioned earlier, Bustabit contests are completely random. There is no such a thing as a predictor for a completely random event. Important: Bustabit crash predictors are not a thing! Some fallacies only require basic math to be debunked. This is one such case. The entire game is based on the fact that you can't predict the next draw.If you could predict the next draw, then the house would go broke! Finally, if there was such a thing as a Bustabit predictor, then many top players would guess the same or similar multiplier on a large number of games. It'd become obvious to the other players that some algorithm was being used and even more players would either buy or develop their own. Or it'd turn skeptical gamers away, either way it'd be a lose/lose situation for the house. These arguments, of course, do not prove that there isn't some bias that certain players exploit in Bustabit. If you saw a group of users consistently winning using very similar multipliers, you'd begin to wonder whether there is some working script. Bustabit Bits to USD One Bustabit bit is equal to 100 Satoshi. To find out how much Bustabit bits are worth in USD, simply enter /convert 1000 bits USD on the Bustabit chat. Or you can easily convert Bustabit bits to USD yourself, simply divide Bitcoin price by 1 million. So, at today's Bitcoin price of US 19,500 one Bustabit bit would cost US 0.0195 or approximately 2 cents of a dollar. Is Bustabit Legal? Bustabit is illegal in the following countries: Aruba Australia Curaçao France Netherlands Sint Maarten United States of America Users under 18 are also not allowed to use the service. Bustabit may sometimes request proof of age or locality in order to ensure users aren't accessing the game from a disallowed location. Bustabit may be illegal in your region so, if in doubt, ask a professional whether it's OK to access the service in your area. So, I cannot play Bustabit from the United States? That is correct. Citizens or residents in USA are not allowed to play Bustabit for legal reasons. Is Bustabit Provably Fair? Bustabit is not a provably fair game. Although Bustabit leverages cryptocurrency for gameplay, it does not use the blockchain for the actual draws. In fact, Bitcoin is only used in Bustabit for convenience. There's nothing in the core Bustabit gameplay that depends specifically on blockchain technology. As such, there's no algorithm to prove fairness in Bustabit. We assume the house crashes to be random but players must actually trust the game in that respect. Bustabit Does not use Bitcoin. Bustabit is down for some reason. This may be a client error, such as a ISP network failure, or server-side error. The latter means Bustabit itself is in technical trouble. To check whether Bustabit is functional at the moment, use this Bustabit down check.Unfortunately, checks on your ISP must be performed locally, such as using a speed test. Local problems cannot be detected by server-side checks such as the Bustabit down checker. Bustabit Data Unfortunately, there isn't a free Bustabit dataset available for statistical tests. We do know that some players have been attempting to find statistical flaws in Bustabit, but so far the game has been proven to be truly random. Bustabit itself publishes some basic statistics, but these can't be directly used to attempt to predict Bustabit crashes and increase your odds at the game. A leaderboard is also made available. We've derived some interesting strategies from the leaderboard earlier in this article, but that's as much Bustabit data as we were able to analyze. Conclusion Well I've covered more than I'd like to about Bustabit. Gambling isn't my favorite topic but Bustabit has become so popular recently, I thought I'd share some of my own gambling and investing experience with you. Bustabit is a completely random game. There is no way to predict it or write algorithmic solutions for it. Unlike stocks and crypto trading, volume and price data do not shape the next outcomes.So, writing scripts to try and predict future game outcomes based on previous results is an exercise in futility. Having said all this, Bustabit can be fun and addictive. It deals with real money, so all the appropriate disclaimers apply. I guess I've made it clear throughout the text that Bustabit is 100% pure gambling. So there isn't just one winning strategy. The only consistent way to protect yourself and try to win at Bustabit is to keep your multipliers very low. If you always exit near the low 1.x multipliers, you'll cut your risk immensely. Keep in mind it's still possible to lose your entire stash by using this (or any other) strategy. GameCredits (GAME) Provably Fair Games, Explained Official Website GameCredits takes on Apple and Google with its blockchain-based app store Announcement Thread link to BitcoinTalk A well known Bitcoin Puzzle TL Provably Fair Calculator Bitcointalk Thread on Provably Fair Exploits Official WebsiteRemember bitcoin? Remember all the hype and buzz around how it would 100x tomorrow and then crash down the next day? How it was the riskiest investment you could make, while also being one of the biggest money makers of 2017-2018?Regardless of what your perspective is, it's kind of tough to forget. But the one thing we all remember the most, was how risky it all was. Seriously, there's no telling where this thing will go next. When moon? Now take all that risk... all that price volatility...all the FUD, hype, whatever other terrors and fears that bitcoin has put you through, and put it into gambling. And what do you get? A provably fair betting system. Wait, what? Fairness? Fairness with bitcoin? Allow me to explain. Provably Fair betting systems To explain how such a system works, I will be using one of the more popular implementations of this platform, bustabit.com, as an example. A screenshot of a game in action. The multiplier for the game is shown in the top left, with game history right below, and users shown on the right. Bustabit works by depicting a "multiplier" that continuously increases from 1.00x, until it "busts". You place your bets in bitcoin (broken down into millionth units known as bits), and if you cash out before the game busts, you get your money multiplied by that multiplier. But if you DON'T cash out in time, you get nothing. Now the question is, where do these multipliers come from? Is the house just randomly deciding what to put it at? Definitely not (for starters, that would be very illegal). Instead, we can prove that there are reasonably "fair" odds for the house and the player (51/49 respectively). Here's how: Bustabit uses a secret key with SHA-256 to generate a chain of 10,000,000 hashes, salted with the hexadecimal string of bitcoin block 505750. The reasoning for this specific salt, is because this block had not yet been mined when bustabit v2 was developed, thus proving that there was no way the house could deliberately pick a chain that is unfavorable for players. Once salted, these hashes are then put into an algorithm which converts the hexadecimal hash into its binary representation, and performs a series of bitwise operations. Finally, the binary output is converted into decimal, which gives us our multiplier. You can read the finer technical details here. If that sounded a little confusing, that's fine, it's supposed to be. In layman's terms, it simply means that there is a secret password that generates a long string of characters (hash), and this string can be put into a publicly known algorithm to verify the same multiplier that bustabit displays. Essentially proving that there is no way the house can be manipulating the gambling game as it was launched. Here's where things get interesting Once you understand how the algorithm works, you then start to realize the sheer potential of how far this gambling beast can go. Given that the chain of 10,000,000 games has already been pre-calculated, it was determined to have 50% of the multipliers fall somewhere between 1.00-1.98x, with the other multipliers falling anywhere above that. For 1.00x's, there are simply straight house wins, and all players lose their bet. This is similar to a 0 or 00 in roulette. Now, just how often are these 1.00x's?Plugging the numbers into plotly, a charting library for various frameworks, we get this: A disgustingly beautiful pie chart of the proportional sizes between 1.00x-1.98x. View online here. While this does look like someone just vomited play-doh, the numbers here are interesting. Essentially, this is a graph of the most frequent multipliers found on bustabit. The closer the multiplier is to 1.00x, the more likely it is to occur (with 1.00x having appeared ~25,000 times in the past 1,300,000 games. Ouch to the players). As shown in the graph, 1.00x represents ~4% of half the total multipliers found in the games chain, thus representing a 2% chance of it occurring on a bet, where you lose everything. On the other hand, you could always go for the tinnest amount of profit and aim for the 1.01x's, which would give you a very conservative profit chance of 98%. However, in order to get reasonable returns, this is a very high-risk low-reward bet, as you are risking large sums of bits for practically pennies (which hey, bitcoin used to be at by the way). Perhaps this is why these "Provably Fair" types of games are so alluring to the players. 98% chances of profit? You will never see that anywhere else in a casino. However, as alluring as this can be, there is still a 2% chance of losing your entire bankroll. An example of one greedy player who continuously went all-in on 1.01's, only to lose it all on a 1x. On the other hand, perhaps the allure is not how conservative you can be, but how risky you can take a bet. Remember how I said that the multiplier continues upward of 1.00x? Well, just how high can it go? 10? 20? 40? Let's ask nyanecat. nyanyanyanyanyanyanyanyanyanyan Yes that's right. 23,000x. Broadly speaking, any multiplier over 1,000x will trigger a nyanecat animation, practically mocking you if you cashed out earlier and missed out on such potential (or, celebrating because every player should have profited and cashed out before this event. Cup half-empty half-full scenario). Of course, there is a maximum profit that a player can make, which is 1.125% of the house's bankroll (currently ~39.8 BTC as of writing). This is to avoid draining the bank of its funds. These nyanecats have a very rare chance of occurring, with odds as low as 0.1%. But for some players, these treasures are worthy of chasing. An example of such a player, commonly known as a "Sniper". By continuously betting 901, and only cashing out on big nyanecats, he will eventually hit his target (and eventually lose it all as well). But 23,000x is not even the biggest. No, far from it. The biggest multiplier seen so far? We'll need a script for that. Using my handy dandy tool python, I was able to use the bustabit verification algorithm to input a hash that gives us the resulting multiplier. Using this, we can then compute all previous bustabit games (and verify its game history. Sorting it out, we can see what I like to call the "Titans" of bustabit, with the biggest multiplier of them all being... *drum roll* 13239239.65x Yes you heard me, a multiplier of 13 million has occurred in this game, which is honestly just baffling. Don't believe me? You can prove it with the hash! 24c9b51c72a2e7766124ca1c0f0b72212b24262664a74d0da8e4cb50da84254 Plug that hash into here and you should get the same result.This monster of a multiplier must have been insanely fun to watch, and seems to have occurred very early on in bustabit v2. Curious, I decided to graph the other titans of bustabit using plotly again. Here's our top ten biggest multipliers. A god among titans. In awe at the size of this lad. It's like comparing the Sun to the planets. Given that we are only 1.3 million games in, it would be amazing to see this record broken. Final thoughts As exciting as all of these luxurious multipliers may be, I must make it abundantly clear that gambling will always be against you. Even in Provably Fair betting systems, with bustabit having a respectable small house edge of 1%, that is still 1% in their favour. And in the grand scheme of things, the house always wins. Below is one of the clearest examples of the dangers of gambling. A user who joined a mere 3 weeks ago as of writing,With an all time profit of ~200 bit, he eventually lost it all, amounting to a total loss of 726 bitcoin (~3 million as of writing). So whether you are betting your life savings, or just trying to make beer money, all players eventually lose the longer they play. No matter how provably fair the system may be, there's no point in it existing if the house doesn't get it's profits. Eventually, you will bust.
