Cisco Jabber for iPhone configuration guide

EnableSIPURIDialling true false Enables URI dialing with Cisco Jabber and allows users to make calls with URIs. true Users can make calls with URIs. false Users cannot make calls with URIs. This is the default value. Step 4 Enter a name for the service profile in the Name field. true The password will be prefilled and Automatic sign-in will be shown. Step 7 Specify the IP address of your primary TFTP server in the TFTP Server field. Separate SSIDs with a forward slash (/). The client cannot read configuration files that do not have a valid XML structure. Step 8 Specify the IP address of your backup TFTP servers in the Backup Server #1 and Backup Server #2 fields. The client retrieves the settings from the phone configuration in addition to the configuration in the UC service profile. Step 9 Select Save. Use lowercase letters in the filename to prevent errors and to ensure the client can retrieve the file from the TFTP server. true Enables meetings capabilities and user interface. The following table lists the configuration parameters you can set in the instant messaging and presence profile: IM and Presence Service Configuration Description Product type Provides the primary source of authentication to Cisco Jabber and has the following values: Unified CM (IM and Presence) Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence is the primary source of authentication. Enables or disables Dial via Office. Ensure that the credentials source that you set match the user's conferencing credentials. Step 5 Select a service profile to apply to the user from the UC Service Profile drop-down list. Step 3 Enter the appropriate search criteria to find existing users and then select a user from the list. Step 2 Define the required configuration parameters in jabber-config.xml. Note In some versions of Cisco Unified Presence, this path is as follows: . For best results and access to the latest features, your mobile device should be running the latest iOS version. Remember: If your environment has multiple TFTP servers, you must ensure that the configuration file is the same on all TFTP servers. You can configure some client settings in UC service profiles on Cisco Unified Communications Manager version 9 and higher. WebEx (IM and Presence) The Cisco WebEx Messenger service is the primary source of authentication. Disabled Users cannot send or receive video calls. Note On Cisco Unified Communications Manager version 9.x only, users who have only instant messaging capabilities (IM only) must use the default service profile. Step 5 Select Make this the default service profile for the system if you want the service profile to be the default for the cluster. If the structure of your configuration file is not valid, the client cannot read the values you set. Step 9 Select Save. Use lowercase letters in the filename to prevent errors and to ensure the client can retrieve the file from the TFTP server. true Enables meetings capabilities and user interface. The following table lists the configuration parameters you can set in the instant messaging and presence profile: IM and Presence Service Configuration Description Product type Provides the primary source of authentication to Cisco Jabber and has the following values: Unified CM (IM and Presence) Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence is the primary source of authentication. Enables or disables Dial via Office. Ensure that the credentials source that you set match the user's conferencing credentials. Step 5 Select the appropriate cluster from the list. The client downloads the global configuration file from your TFTP server during the login sequence. The following table lists the configuration parameters you can set in the voicemail profile: Voicemail Service Configuration Description Voicemail server Specifies connection settings for the voicemail server. When users launch the client, it discovers the Cisco Unified Communications Manager home cluster using a DNS SRV record and automatically retrieves the configuration from the UC service profile. Voicemail Enabled true false Enables voicemail capabilities and user interface in the client. Important: The value you specify must match the directory URI setting for users in Cisco Unified Communications Manager or the Cisco WebEx Administration Tool. Attention: If Cisco Jabber gets the _cisco-uds SRV record from a DNS query, it can automatically locate the user's home cluster. Ensure the user's phone service credentials match their voicemail service credentials. The Edit Cluster window closes. Check the Apple App Store to ensure that Jabber client is updated to the latest version. Disabled Users cannot dial via office. The Service Profile Configuration window opens. Procedure Step 1 Open the Cisco Unified Presence Administration interface. Preset Wi-Fi Networks (SSIDs) approved by your organization. Use utf-8 encoding. The Find and List UC Services window opens. If you do not use service discovery with Cisco Unified Communications Manager version 9 and higher, the client retrieves UC services from Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence. You can host configuration files on any TFTP server. Phone Configuration You can set some client settings in the phone configuration on Cisco Unified Communications Manager version 9 and higher. Dial via Office Note It is for TCT device only. Configure the client for all users in your deployment. Credentials source for voicemail service Specifies that the client uses the credentials for the instant messaging and presence or conferencing service to authenticate with the voicemail service. Step 10 Select Save in the Unified Communications window. Step 3 Locate the Legacy Client Security Settings section. Step 3 Host the group configuration file on your TFTP server. Step 3 Locate the fields to specify TFTP servers in one of the following sections, depending on your version of Cisco Unified Presence: Cisco Jabber Security Settings CUPC Global Settings Step 4 Specify the IP address of your primary and backup TFTP servers in the following fields: Primary TFTP Server Backup TFTP Server Backup TFTP Server Step 5 Select Save. When users sign in to Cisco Jabber, the client can then retrieve the service profile for that user from Cisco Unified Communications Manager. Procedure Step 1 Create a file named jabber-config.xml with any text editor. Step 6 Do not specify a value in the Directory text box in the Upload File section. Learn which configuration parameters you can set in service profiles. Important: You must create a global configuration file to set up: Directory integration for on-premises deployments. Directory Contains configuration parameters for directory integration. Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence You can enable instant messaging and presence capabilities and configure certain settings such as presence subscription requests. Cisco WebEx Org Admin You can configure some client settings with the Cisco WebEx Administration Tool. Step 3 Select Add New. Procedure Step 1 Open the Cisco Unified Serviceability interface on Cisco Unified Communications Manager. Voicemail Contains configuration parameters for the voicemail service. Your XML can contain only valid XML character entity references. Policies Contains configuration parameters for policies. You must restart your TFTP server before the client can access the configuration files. The Unified Communications window opens. Users can allow the client to cache their password. See the Integrate with Directory Sources chapter for information about configuring directory integration in a service profile. The Cisco Tftp Restart Operation was Successful status displays. When users sign in, the client retrieves the XML file from the TFTP server and applies the configuration. The UC Service Configuration window opens. Step 5 Select the configuration file on the file system. Complete the steps to specify the address of your TFTP server on Cisco Unified Presence. The following table lists the configuration parameters you can set in the Product Specific Configuration Layout section of the phone configuration and maps corresponding parameters from the client configuration file: Mobile Client Settings Configuration Description On-Demand VPN URL for initiating on-demand VPN. Step 6 Select Refresh to ensure the Cisco Tftp service starts successfully. true Enables voicemail capabilities and user interface. What to Do Next Apply service profiles to end user configuration. false Disables audio and video capabilities and user interface. Step 6 Select Advanced Server Settings in the Cisco Unified Communications Manager Server Settings section. For IM only users, Cisco Unified Communications Manager version 9.x always applies the default service profile regardless of what you select from the UC Service Profile drop-down list. Video Capabilities Enables or disables video capabilities. Step 5 Select OK. After you add and configure UC services, you add them to a service profile. Applies to cloud-based deployments only. ILS enables the client to find the user's home cluster and discover services. Step 7 Select Upload File. Those with a University-owned device are required to have MDM installed. Common Policies Cisco WebEx Policies The following table describes the parameters you can specify within the Policies element in both on-premises deployments and hybrid cloud-based deployments: Parameter Value Description EnableVideo true false Enables or disables video capabilities. If you use the Cisco WebEx Messenger service for instant messaging and presence capabilities, you can set policies for the client through the Cisco WebEx Administration Tool. You should leave an empty value in the Directory text box so that the configuration file resides in the default directory of the TFTP server. In on-premises deployments, you should set the credentials source for voicemail service. Add UC services to specify the address, ports, protocols and other settings for services such as instant messaging and presence, voicemail, conferencing, and directory. false Disables meetings capabilities and user interface. Note For information about directory parameters, see the Integrate with Directory Sources chapter. Ensure you check the structure of your configuration file for closing elements and that elements are nested correctly. Step 2 Select. Telephony Enabled true false Enables audio and video capabilities and user interface in the client. The Edit Cluster window opens. Devices do not connect to secure connect if connected to one of the entered Wi-Fi networks. Enabled Users can send and receive video calls. For this reason, you should set the service profile as the default if you plan to apply the service profile to IM only users. Cisco Jabber for Tablet (TAB) Configuration Applies to individual TAB devices and takes priority over the group configuration. Users cannot allow the client to cache their password. In an environment with multiple Cisco Unified Communications Manager clusters, you must configure the Intercluster Lookup Service (ILS). Client Configuration Files You can create XML files that contain configuration parameters. Step 4 Select Browse in the Upload File section. false The password field will be empty and Automatic sign-in will not be shown. As a result, the client can also locate the Cisco Unified Communications Manager TFTP server. Users must enter their password each time the client starts. Applies to on-premises and cloud-based deployments. See the appropriate version of the Cisco Unified Communications Manager Features and Services Guide to learn how to configure ILS. If Internet Explorer displays the entire XML structure, your configuration file does not contain invalid characters or entities. Review the corresponding parameters in the client configuration file. After you add UC services and create a service profile, you apply the service profile to users. Step 4 Specify the IP address of your primary and backup TFTP servers in the following fields: Primary TFTP Server Backup TFTP Server Backup TFTP Server Step 5 Select Save. Procedure Step 1 Open the Cisco Unified OS Administration interface on Cisco Unified Communications Manager. The first step in configuring the client is to specify your TFTP server address so the client can access your configuration file. Voicemail service credentials for hybrid-cloud deployments. Applies to on-premises deployments only. Related Information Using policy actions available in Cisco WebEx You can specify service credentials parameters so that users do not need to authenticate with certain services. You should set this parameter in hybrid cloud-based deployments only. The following is an example of the voicemail service credentials parameter: phone The following table describe the voicemail service configuration parameters you can specify within the Voicemail element: Key Value Description VVM Mailstore Server 0 Hostname IP address FQDN Specifies the address of your voicemail server. You then host the XML files on a TFTP server. Primary server Specifies the address of your primary presence server. If Internet Explorer displays only part of the XML structure, your configuration file most likely contains invalid characters or entities. Installation Sign in Sign out Cisco Jabber can retrieve configuration settings from the following sources: Service Profiles You can configure some client settings in UC service profiles on Cisco Unified Communications Manager version 9 and higher. Refer to the Server Setup Guide for detailed instructions on provisioning users with meetings capabilities in a service profile. If the client connects to the Cisco WebEx Messenger service, you specify your TFTP server address with the Cisco WebEx Administration Tool. Procedure Step 1 Open the Cisco Unified CM Administration interface. On-Premises Deployments You should specify the fully qualified domain name (FQDN) of Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence. The Find and List Users window opens. The client gets configuration files from a TFTP server. Note All settings in the service profile obtained via UDS will overwrite the configuration in Cisco WebEx Administration Tool. You can specify the following parameter to configure voicemail service credentials within the Voicemail element: Parameter Value Description VoiceMailService UseCredentialsFromPhone Specifies that the client uses the phone service credentials to access voicemail services. Typically, you can access the global configuration file at the following URL: You create client configuration files in an XML format that contains the following elements: The configuration file must conform to XML standards and contain the following declaration: The root element, config, contains all group elements. You must also add the version attribute to the root element as follows: Group elements contain configuration parameters and values. What to Do Next Add your UC services to service profiles. The client can retrieve UC service configuration and other settings from service profiles. If your XML contains invalid characters, the client cannot parse the configuration file. The Legacy Client Settings window opens. Step 2 Select the Configuration tab. Use lowercase letters in the filename. DirectoryURI See the description on the right column Specifies the directory attribute that holds the SIP URI for users. false Disables voicemail capabilities and user interface. Global Configuration Files Configuration File Requirements Global configuration files apply to all users. Procedure Step 1 Open the Cisco WebEx Administration Tool. Enabled Users can dial via office. Step 4 Select the UC service type you want to add and then select Next. This is the default value. You can apply additional configuration in the service profile. In on-premises and hybrid cloud-based deployments you can create client configuration files and host them on the Cisco Unified Communications Manager TFTP service. Complete the steps to specify the address of your TFTP server on Cisco Unified Communications Manager IM and Presence. A window displays to prompt you to confirm the restart. The Cisco Jabber Settings window opens. Step 3 Select Cisco Tftp from the CM Services section. This parameter is not set by default. What to Do Next To verify that the configuration file is available on your TFTP server, open the configuration file in any browser. You cannot configure the client with service profiles if you do not set up your DNS environment for service discovery. Important: In order to support URI search in BDI, set BDIUseANR to false in jabber-config.xml. The following snippet shows the XML structure of a client configuration file: value The following is an example configuration for an on-premises deployment: true BDI True sAMAccountName 11.22.33.44 Cisco.com 389 CN=Users,DC=cisco,DC=com false The following table describes the parameters you can specify within the Client element: Parameter Value Description CachePasswordMobile true false Specifies whether the password is remembered or not on the client side. For example, use & instead of *. This option allows users to automatically sign in when the client starts. Tip Open your configuration file in Microsoft Internet Explorer to see if any characters or entities are not valid. Step 4 Select the Clusters tab. However, Cisco recommends hosting configuration files on the Cisco Unified Communications Manager TFTP server, which is the same as that where the device configuration file resides. In cloud-based deployments, you should configure the client with the Cisco WebEx Administration Tool. See Using policy actions available in Cisco WebEx for a list of available policies and descriptions. Ensure that the credentials source that you set match the user's voicemail credentials. Default Ringtone Sets the default ringtone to Normal or Loud. Important: Cisco Jabber only retrieves configuration from service profiles on Cisco Unified Communications Manager if the client gets the _cisco-uds SRV record from a DNS query. Step 5 Configure the UC service as appropriate and then select Save. Step 4 Select Restart. true Enables audio and video capabilities and user interface. Configuration filenames are case sensitive. Step 4 Locate the Service Settings section. Meetings Enabled true false Enables meetings capabilities and user interface in the client. Set one of the following as the value: Hostname (hostname) IP address (123.45.254.1) FQDN (hostname.domain.com) Step 6 Add your UC services, apply any additional configuration, and then select Save. However, you can optionally set up a TFTP server to configure the client with settings that are not available in Cisco WebEx Administration Tool. Step 3 Select Unified Communications in the Additional Services section. Policies parameters let you control specific client functionality. Cloud-Based Deployments The client uses the following URL as default when you select WebEx as the value for the Product type parameter: This default URL overrides any value that you set. false Users cannot make or receive video calls. On-Premises Deployments Set one of the following as the value: mail msRTCSP-PrimaryUserAddress Cloud-Based Deployments Jabber uses email by default and it cannot be modified. The Cisco Jabber app allows you to chat and collaborate with your co-workers from your iPhone or iPad. Review details about configuration files and understand requirements such as supported encoding, true Users can make and receive video calls. Procedure Step 1 Open the Cisco Unified CM IM and Presence Administration interface. If you set a value for this parameter, users cannot specify their voicemail service credentials in the client user interface. You must nest group elements within the root element. The End User Configuration window opens. Review the XML samples in this chapter for more information. If you set this configuration, users cannot specify voicemail service credentials in the client interface. Note Do not rename the jabber-config.xml file. The following table lists the configuration parameters you can set in the conferencing profile: Conferencing Service Configuration Description Conferencing server Specifies connection settings for the conferencing server. Step 3 Select Upload File. The client can retrieve configuration settings in the phone configuration from the following locations on Cisco Unified Communications Manager: Cisco Dual Mode for iPhone (TCT) Configuration Applies to individual TCT devices and takes priority over the group configuration. The default name for the global configuration file is jabber-config.xml. Important: Cisco Unified Communications Manager version 9.x only: If the user has only instant messaging and presence capabilities (IM only), you must select Use Default.

11_09_2020 - Planning Guide for Cisco Jabber 12.6. Chapter Title. Requirements. PDF - Complete Book ... Cisco Jabber for Android and Cisco Jabber for iPhone and iPad clients only. Platform-dependent. Cisco Expressway C ... Region configuration on Cisco Unified Communications Manager can limit the bandwidth available to the client. 19.01.2017 - iPhone and iPad-42.2. Share your screen on Wayland-Linux. When you're in a call, meeting, or you're just messaging in a space, you can show people what you're talking about by sharing your screen. Your Linux system must be ... 23.10.2018 - Cisco Jabber for Windows 9.6.x Cisco Jabber for iPhone and iPad 9.6.0 Support of the fixed pinpoint subdomain has been replaced in later versions of Cisco Jabber by the support of the new VoiceServicesDomain configuration key. Example configuration using Service Discovery to replace pinpoint subdomains: Internal DNS authoritative for : example ... 05.06.2018 - Cisco Jabber Client for Android 4.0.4 (ice cream sandwich) and 2.3 (gingerbread). Release Date: 10 October 2012 Version: 9.0.1.1911. This version has been released for users who are experiencing registration problems with Cisco Jabber from Google Play Store. 19.01.2022 - Cisco Jabber 9.2.2 (Driver Enhancements and Bug fixes) Microsoft Lync (show "In a Call" status) Cisco Unified Personal Communicator (Hold/Resume handling for Passive calls) New features and enhancements: Show Call Manager during call, with menu support for both incoming and outgoing calls Something is turning it on without me opening any Cisco apps including any connections so this is because of Cisco not another IT department Developer Response. AnyConnect does not automatically connect; it is only triggered by the UI or by On-Demand or Per-App VPN profiles configured on the device.
